EXECUTIVE SUMMARY

Summary

This report has been prepared for Watercare to provide an assessment of effects on archaeological and historic heritage values of the proposed Northern Interceptor Phase 1 alignment. This report does not include an assessment of effects on Maori cultural values.

The assessment included a review of relevant historic heritage databases (the New Zealand Archaeological Association ArchSite database, the Auckland Council Cultural Heritage Inventory, District Plans and Proposed Auckland Unitary Plan schedules and the Heritage New Zealand Heritage List. Previous archaeological reports relevant to the project area were consulted, as were early survey plans held at Land Information New Zealand (LINZ) and historic aerial photographs. Visual inspections of the proposed alignment were undertaken on 23 December 2013 and 24-28 November 2014.

Multiple archaeological and historic heritage sites have previously been recorded within c.100m of the proposed alignment; however, the proposed works will have no effects on these sites. No archaeological or historic heritage sites were identified within the alignment of the proposed Northern Interceptor Phase 1 works as a result of the survey and assessment, but it is possible that unidentified subsurface remains may be present in coastal areas at Wainoni Park, North Shore Memorial Park and Rahui Reserve.

Recommendations

- The detailed development plans should take account of the locations of the recorded archaeological sites, and ensure that they are avoided.
- The recorded midden site R10/1187 in the vicinity of proposed earthworks in Wainoni Park should be temporarily marked out or fenced off prior to the start of earthworks to protect it from accidental damage from heavy machinery.
- If any of the recorded sites cannot be avoided, an Authority must be applied for under Section 44(a) of the HNZPTA and granted by Heritage NZ prior to the start of any works that will affect them. (*Note that this is a legal requirement*).

Continued on next page

EXECUTIVE SUMMARY, CONTINUED

Recommendations,
continued

- Because it is possible that subsurface archaeological remains may be exposed during development, an Authority should be applied for under Section 44(a) of the HNZPTA as a precaution prior to the start of earthworks. This would establish appropriate procedures for the management of any archaeological remains discovered, reducing the potential for delays during the development process.
 - Earthworks at Rahui Reserve, Wainoni Park North and the southern end of works at the North Shore Memorial Park should be monitored by an archaeologist to establish whether any unrecorded subsurface archaeological remains are present.
 - In the event of koiwi tangata (human remains) being uncovered, work should cease immediately in the vicinity of the remains and tangata whenua, the Heritage NZ, NZ Police and Council should be contacted so that appropriate arrangements can be made.
 - Since archaeological survey cannot always detect sites of traditional significance to Maori, such as wahi tapu, the tangata whenua should be consulted regarding the possible existence of such sites along the length of the proposed alignment.

INTRODUCTION

Project Background

Watercare Services Limited ('Watercare') is proposing to build new wastewater pipelines and associated infrastructure to convey wastewater from north-western parts of Auckland to the Rosedale Treatment Plant ('WWTP') in Albany (Figure 1). This project is known as the 'Northern Interceptor'. Construction of the Northern Interceptor is intended to be staged, with the timing of various stages depending on the rate of population growth.

Clough & Associates has been commissioned by Watercare to assess the potential archaeological and historic heritage effects related to the construction, operation and maintenance of the proposed Northern Interceptor Phase 1 (Figure 1).

The proposed work requires various resource consents under the Resource Management Act 1991 ('RMA'). This technical report provides specialist input for the *Northern Interceptor Phase 1 – Assessment of Effects on the Environment* report ('the AEE') prepared by MWH New Zealand Limited, which supports the resource consent application. This report also identifies any requirements under the Heritage New Zealand Pouhere Taonga Act 2014 ('HNZPTA'). Recommendations are made in accordance with statutory requirements.

This report provides the following:

- A brief overview of the proposed works;
- A description of the methodology employed in preparing the report;
- An overview of the historic background of the project area;
- An overview of the archaeological background of the project area;
- Results of field survey;
- An assessment of the actual or potential effects on the archaeological and historic heritage environment through the proposed construction, having reference to the statutory framework. This includes the identification of activities that could result in adverse effects and, in turn, identifying design refinements or construction methodologies that could avoid, remedy or mitigate such effects;
- Recommended mitigation and management measures.

Continued on next page

INTRODUCTION, CONTINUED

Proposed Works

The proposed Northern Interceptor Phase 1 will transfer existing flows from the Hobsonville Pump Station to the Rosedale WWTP. The proposed route is from the existing Hobsonville Pump Station, under the Upper Harbour Highway, along the northern side of the motorway causeway, and then under the Upper Waitemata Harbour, through Greenhithe and then the commercial area of Rosedale (Figure 1).

Key elements of the project include:

- Upgrading of the existing Hobsonville Pump Station;
- Installation of a pipe under SH18;
- Installation of pipelines in a widened section of the existing motorway causeway;
- Installation of dual pipelines across the Upper Waitemata Harbour to Greenhithe via marine trenching or horizontal directional drilling ('HDD');
- Installation of pipelines under Lucas Creek via HDD;
- Construction of a pipe bridge between Witton Place and North Shore Golf Course and across streams at Wainoni Park;
- Trenched construction for pipeline installation in roads, open space and other land; and
- Associated infrastructure including chambers, minor above ground structures, scour valves, connections to existing infrastructure and air treatment facilities.

With the exception noted below, the proposed works are described in detail in the main AEE. Key drawings showing the proposed works and construction methodology are copied in Appendix A of this report. The works described in the main AEE and shown on the appended drawings are assessed in this report.

Watercare is proposing some widening along the existing Upper Harbour Highway causeway near Hobsonville to provide for proposed water and wastewater infrastructure, including a section of the Northern Interceptor Phase 1 pipeline. That work forms part of Watercare's proposed Greenhithe Bridge Watermain Duplication and Causeway project. That project is part of a separate resource consent package and is described in a report entitled *Greenhithe Bridge Watermain Duplication and Causeway – Assessment of Effects on the Environment*, prepared by URS New Zealand.

INTRODUCTION, CONTINUED

Methodology The New Zealand Archaeological Association's ('NZAA') site record database (ArchSite), Auckland Council's Cultural Heritage Inventory ('CHI'), Auckland Council District Plans – Operative North Shore Section 2002 and Operative Waitakere Section 2003 Plan and Proposed Auckland Unitary Plan ('PAUP') schedules and the Heritage New Zealand ('Heritage NZ') New Zealand Heritage List were searched to determine whether any archaeological sites had been recorded on or in the immediate vicinity of the proposed Phase 1 alignment. Literature and archaeological reports relevant to the area were consulted (see Bibliography). Early plans held at Land Information New Zealand (LINZ) and historic aerials were checked for information relating to past land use within the project area.

Visual inspections of the proposed alignment were conducted on 23 December 2013 and 24-28 November 2014. Fiona McKenzie, representing the Ngati Manuhiri Settlement Trust, was present during the survey of Wainoni Park and the North Shore Memorial Park areas of the alignment. The ground surface was examined for evidence of former occupation (in the form of shell midden, depressions, terracing or other unusual formations within the landscape, or indications of 19th century European settlement remains). Exposed and disturbed soils were examined where encountered for evidence of earlier modification, and an understanding of the local stratigraphy. Subsurface testing with a probe and spade was carried out where possible to determine whether buried archaeological deposits could be identified or establish the nature of possible archaeological features. Particular attention was paid to the spur crests and creek banks (topographical features where archaeological sites are often found to be located). Sites were photographed and GPS readings taken. Field sketches were made as required and site record forms written or updated.

The assessment of effects on archaeological values took into account the potential for effects on any archaeological remains of pre-1900 date and any significant post-1900 archaeological remains up to the mid-20th century.

HISTORICAL BACKGROUND

Pre-European Settlement¹

The Hobsonville and Greenhithe areas, and other locations along the creeks and inlets of the inner reaches of the Waitemata Harbour, were occupied by Maori for generations before the arrival of Europeans, evidence of which survives in the form of recorded place names, oral traditions and archaeological sites (although many have been destroyed by 19th and 20th century development and natural processes).

Through time a number of iwi have had influence over the region. Of particular significance were Waiohua, Te Kawerau and Ngati Whatua and the many hapu related to these groups (Clough & Tanner 2004). However, other hapu from outside the region also maintained rights to fish in the waters of the Waitemata through the summer months, and sites in the area may relate to any of these groups.

The records that survive indicate that settlement focused on the upper reaches of the harbour around Hellyers and Lucas Creeks, particularly at the entrance to these creeks. Te Wharemoenanu was a small settlement on a small peninsula on the southern side of the entrance to Lucas Creek (Okahukura). On the northern side at the entrance to Hellyers was the settlement at Tauhinu pa (also known as NZAA site R11/285). There were numerous occupation sites along the entire foreshore as well as settlements bordering on Lucas Creek, stretching as far upstream as the township of Albany. These continued along branches of the estuary – for example, there was a settlement known as Te Karaka near the head of the Te Wharau Creek and another located on Awaiti, an arm of Te Wharau Creek. These settlements were occupied permanently, with fluctuations in use associated with seasonal gathering by groups coming from the larger Tamaki isthmus region.

The Okahukura (Lucas Creek), reaching out from the Waitemata, and the Okura river on the east coast, like many rivers and estuaries on the isthmus, were of considerable significance as communication routes. In combination with inland route ways such as the Oteha Valley and the continuous ridgeway of Lonely Track Road, these rivers would have provided easy access to coast and harbour. The importance of these waterways to Maori is attested by the presence of pa such as Dacre Point (R10/291) at the head of the Okura, and Tauhinu, which commanded the entrance to the upper harbour near Oruamo or Hellyers Creek, and the many shell midden and other sites recorded along the river and stream banks.

INTRODUCTION, CONTINUED

Early European Settlement²

The Greenhithe and Albany areas, of which the study area is a part, were first acquired from Maori for early European settlement through Crown purchases during the mid-1840s. From 1853 the land was further divided through Crown Grants under the provisions of the Waste Lands Act 1853 (King 1984).

The settlement at Greenhithe was initially very sparse due to its isolation and lack of access via roadways. The first known permanent settler was George Deane, who purchased 69 acres in 1858, and a few other settlers acquired land after this. In 1865 Mary Forgham purchased land from the Revd Thomas Hamer, and the land was named 'Fern Bank', which was the first European name given to the area (Dunmore 2001). A later landowner, Henry James Blyth, named the land Greenhithe after a small village on the banks of the river Thames in England. This became the official name of the area as accepted by the Post Office in 1884. However, the whole peninsula was still known by two names – Lucas Creek and Greenhithe are listed on the 1891 census (Dunmore 2001).

From its establishment in 1840, Auckland provided a growing demand for timber which was easily extracted from the bush adjacent to the harbour and transported down the estuaries within both the Greenhithe and Albany areas. The accessibility of the general area via the estuary is reflected in its European history and archaeology, with Lucas Creek becoming the centre of one of the very early timber industries in Auckland, as it was one of the early sources exploited for kauri. Both the Okahukura and Okura waterways were the scene of considerable industry, with barges plying their waters throughout the latter part of the 19th century (Rickard 1984).

It is generally remarked that the timber industry greatly increased the environmental degradation of the area (King 1984; Scriven 1981). The gum diggers also moved in directly after the first wave of government land purchases and established small camps across Greenhithe and Albany. Two main camps are recorded: (1) Cut Hill situated at the head of Hellyers Creek just inside the northeast border of Greenhithe; and (2) Schnappers Rock Camp. Gum extraction required deep diggings to get easy access to the gum, with burn-offs further contributing to the degradation of forests and soils.

INTRODUCTION, CONTINUED

Early European Settlement, *continued*

After the ephemeral industries of gum and timber extraction more permanent settlers moved into the area. The early farmers remained bound to the estuaries, dependent on them for transport and supplies, and encountered very poor quality leached soils, resulting in many abandoning their land in disgust. Some horticulture was established, but purely at the subsistence level until the late 19th century, when commercial fruit growing was established. Henry James Blyth was shipping apples, peaches, plums, pears and lemons to the Auckland market by 1887 (Dunmore 2001).

In 1866 a passenger ferry service was established by Jeremiah Casey, with jetties at Greenhithe and Albany, and it is possible that there were other stopping points along the estuary. By the late 1800s the volume of sea traffic around the Upper Harbour made the privately owned jetties that were previously utilised unsuitable and the Harbour Board was approached to see if a new public wharf could be built. The new wharf was constructed in 1900 at what is now the Rahui Road Reserve at the end of Traffic Road, Greenhithe. The wharf was 156m long x 1.8m wide with steps and a wooden shed (4 x 4m) located on the end for goods and passengers and a freight crane (Figure 2). Rail lines were later added to trolley goods to and from the boats to the foreshore. Produce and freight would be winched down to the steep bank at what is now Traffic Road to be carted across the wharf. In 1910, to cope with the increase in fruit loads, a cargo shed was built next to the waiting room on the wharf. In 1939, the goods and waiting shed was damaged by a gale and was replaced that same year by a new waiting shed (3 x 2.4m) (King 1984).

The population of Greenhithe stood at around 40 at the turn of the century. By 1906 development was taking place over much of Greenhithe due to years of scrub and bush clearance, along with the construction of new roads allowing subdivisions to be developed. This led to higher settlement numbers over the ensuing early 20th century, with the population reaching 134 by 1926 (Dunmore 2001).

By the 1950s, with the ongoing development of roading, patronage of the Greenhithe wharf had fallen off considerably and the structure began to fall into disrepair. In 1958 the Auckland Harbour Board resolved to demolish the wharf, finally undertaking the demolition in 1960 (King 1984).

The Hobsonville peninsula located in the upper reaches of the Waitemata Harbour, is bordered by the Waiarohia Inlet in the north and Limeburners Bay in the south. In 1853, the Waipareira block was purchased from Ngati Whatua by the Crown and the peninsula was divided into four large land blocks which were sold to settlers in the 1850s (Macready & Clough 2008; Dawson 2007).

Continued on next page

INTRODUCTION, CONTINUED

Early European Settlement, *continued*

The Hobsonville land block which includes the project area was sold to the Rev. D. Bruce in 1855 (block 12 of Waipareira, 375 acres). Bruce sold some of his land to the Waitemata City Council for road access to a wharf in 1883. There is no record of Bruce's use or occupation of his land, and in 1891 he subdivided it into a number of lots (Figure 11, below). About 100 acres on the northwestern side of the block, west of the wharf road, were acquired by the Westbourne Estate. The land appears to have remained undeveloped farmland throughout the 19th century and early 20th, with further subdivision by the Westbourne Estate not planned until 1913. (Macready & Clough 2008).

The early development of Hobsonville from the 1860s until the late 1920s was dominated by the pottery industry centered on Limeburners Bay and Scott Point on the southern side of the Hobsonville peninsula (Clough et al. 2008; Clough & Associates 2010). By the early 20th century, however, the Hobsonville area was also known for the commercial growing of grass seed and oats were successfully cultivated, although after World War I most of the farmland was converted to pasture for stock grazing (Dawson 2007: 15-17).

Continued on next page

INTRODUCTION, CONTINUED

Early European Settlement, continued

In the late 1920s the heavy clay industry at Hobsonville came to an end, but fortunately for the local economy the Hobsonville peninsula was chosen by New Zealand's fledgling air force to become an airbase for both land and sea planes. Work began on the development of the airbase in 1927 and it was not until 2002 that the base finally closed, surplus to Defence requirements (Dawson 2007; Macready & Clough 2008). The former airbase land is now under development as a Special Housing Area.

The Greenhithe (Upper Harbour) Bridge connecting Hobsonville and Greenhithe was constructed in the 1970s. In 2006 a duplicate bridge was constructed abutting the original bridge on its northern side to allow for increased traffic demands (Fletcher Construction Company Ltd 2015).

Information from Early Plans/Aerials

An undated survey plan likely dating to the late 1800s (OLC 110) shows the Greenhithe area as being subdivided into large farm blocks (Figure 3). A further plan dating to 1882 shows the area north of Te Wharau Stream, also subdivided into large farm blocks on the shores of Lucas Creek (Figure 4). The plan shows that all the flat land had been cleared by this stage, and the only remaining bush cover is shown along the creek banks and within stream gullies.

A survey plan (DP 4875) undertaken in 1909 for Misters Widdison and Churchouse of the area now known as Wainoni Park shows the existence of what appear to be a farmhouse and outbuildings as well as a garden, orchard and fowl run (Figure 5). Comparison of this plan with the 1963 aerial shows that the farmhouse still remained on site at that time. The aerial also shows extensive evidence of ploughing over the site (Figure 6).

An aerial photograph dating to 1959 shows the extensive earthworks being undertaken at Rosedale for the establishment of the wastewater treatment plant. Much of the remainder of the area remains in large farm/orchard blocks, although residential areas are evident focused around the shores of the Upper Harbour and Lucas Creek (Figure 7).

A later aerial dating to 1963 shows the expanse of farm and orchard blocks (Figure 8). The aerial also shows the preliminary earthworks being undertaken for the establishment of the North Shore Golf Club (Figure 9). By 1996, the area has been heavily developed. Extensive areas of earthworks are shown within the present day industrial/commercial area to the east of Albany Highway and within Rosedale Park (Figure 10).

Continued on next page

INTRODUCTION, CONTINUED

Information from Early Plans/Aerials, continued

At the Hobsonville end of the project area, an 1891 plan (DP 961) shows the subdivision of the Rev. D Bruce's large land block into farmlet-sized lots (Figure 11). A 1913 plan for an intensive subdivision on the northwestern side of the peninsula (DP 8956) does not appear to have eventuated, and most of this land subsequently became part of the Hobsonville airbase. A 1959 aerial shows the airbase at that stage, prior to the construction of the Greenhithe Bridge in the 1970s (Figure 12).

ARCHAEOLOGICAL BACKGROUND

Physical Environment

The proposed Northern Interceptor Phase 1 alignment is located within the generally heavily developed areas of Hobsonville, Greenhithe, Albany and Rosedale. The Hobsonville area has been substantially modified through the residential development of the peninsula, including the SH18. Greenhithe is characterised by intensive residential housing with large areas of open space, including Wainoni Park which is located on the southern bank of Te Wharau Creek. The park remains undeveloped and is currently utilised as a pony club. The Greenhithe area lies at a moderate elevation above sea level with areas of high elevation along the southern side of the headland (outside the proposed area of works).

The Albany area is characterised by intensive residential subdivision, an extensive industrial/commercial sector and large open spaces – including North Shore Memorial Park and the North Shore Golf Club which are located along the eastern shores of Lucas Creek.

The Rosedale area is surrounded by industrial and commercial developments. The area is centered on Rosedale Park. This is the location of the Rosedale Wastewater Treatment Plant.

Previous Archaeological Work

A number of archaeological assessments have previously been undertaken at various points along the proposed Phase 1 Northern Interceptor alignment. These comprise an extensive coastal survey of the Lucas Creek area undertaken by Auckland Regional Council (Brassey 2010) as well as broad scale structure plan assessments (Clough 1995; Clough & Prince 1999), assessments for infrastructure development (Foster 1998 and 2001) and various assessments for subdivision, residential and commercial development (Bioresarches 1995; Clough & Macready 2008, 2009, 2012, 2013; Macready & Clough 2008; Clough & Prince 1997; Clough & Prince 2001; Foster 1997; Judge 2013, 2013b and 2014; Mosen 1995; Shakles et al. 2011; Sides et al. 1997). The aerial and table shown below give further details as to the assessments known to have been undertaken at the time of writing this report (Figure 13; Table 1).

The assessments all indicate a dominance of sites related to pre-European Maori occupation of the area. These sites are located primarily along the coastal edges of navigable waterways, with very few sites recorded inland.

ARCHAEOLOGICAL BACKGROUND, CONTINUED

Recorded Historic Heritage Sites

There are currently seven archaeological and seven historic heritage sites recorded within c.100m of the proposed Northern Interceptor Phase 1 alignment (Figure 14 – Figure 19; Table 2).

The recorded archaeological sites comprise coastal shell midden deposits related to pre-European Maori settlement of the area. The midden site recorded as R10/818 (Figure 16) may possibly be the settlement referred to in Maori traditional history as being located at Awaiti on an arm of the Te Wharau Creek, originally recorded by Clough in 1995 as a settlement area extending over a large part of the small promontory. Visible archaeological remains comprised extensive deposits of shell midden and a dark modified soil (Clough 1995:15).

The site recorded as R10/816 in the NZAA records (Figure 17) is described completely differently within the Auckland Council CHI records, and it is unknown whether this site should be accurately recorded within Wainoni Park or within the North Shore Memorial Park property.

The seven recorded historic heritage sites comprise existing residential, religious and civic buildings (CHI 3507, 12928, 12936, 19647 and 19648), the remnants of Greenhithe wharf located at the end of Traffic Road (CHI 191 – see Figure 15) and a railway sleeper located within the CMA close to the end of Traffic Road (CHI 17744 – Figure 15).

FIELD SURVEY

Hobsonville Pump Station, SH18 Crossing to Upper Waitemata Harbour Crossing

The Hobsonville end of the proposed Northern Interceptor Phase 1 alignment follows from the connection within the existing Hobsonville pump station (Figure 20), crossing SH18 via micro tunneling, then travels down the northern side of the Upper Harbour Highway (via open cut trenching) and continues along the northern side of the Upper Waitemata Harbour crossing (Greenhithe Bridge). The area was found to have been extensively and significantly modified through the development of SH18 and construction and later modification of the Upper Waitemata Harbour crossing (Figure 21). Exposed soils were noted across the survey area and showed exposed yellow clay with no or very minimal topsoil evident (Figure 22).

Previously recorded shell midden site R11/495 was not located. The area within which it was originally recorded has been completely modified through the construction of the bridge/motorway and pedestrian/cycleway as well as the motorway fence and rock wall revetment (Figure 23). The site has probably been destroyed since original recording. Historic house site CHI 3507 is located c.90m north of the proposed alignment within the PAUP historic heritage overlay for Duke House (PAUP Appendix 9: ID 130) and will not be affected (Figure 24).

No archaeological or historic heritage remains were identified within the Hobsonville section of the Phase 1 alignment.

FIELD SURVEY, CONTINUED

Rahui Reserve and Traffic Road, Greenhithe

From Hobsonville to Greenhithe, the proposed pipe alignment crosses the harbour in a north-easterly direction, meeting with the foreshore at the end of Rahui Road, Greenhithe. The Upper Waitemata Harbour crossing section of the crossing is not included within the scope of this project. The pipeline is proposed to be directionally drilled beneath the foreshore at Rahui Reserve, then open cut through the reserve. This will involve the removal of the toilet block within the Reserve and subsequent construction of a new toilet block. The works will also involve the leveling of ground on the northern side of Rahui Road to accommodate machinery and the excavation of two entry pits within the Reserve (Figure 25).

The alignment then continues up the paper road section of Traffic Road, along the formed section of Traffic Road to connect with Tauhinu Road and Greenhithe Road. An HDD pit and line valves will be excavated within the foreshore reserve at the end of Rahui Road (see Appendix A; Figure 25).

Two sites are currently recorded within the Auckland Council CHI as being located within the coastal reserve (Figure 25). The sites comprise the Sea Scouts building (CHI 19648) and a remnant wharf site (CHI 191).

The sea scout hall is still in use, located to the north of the proposed area of works (Figure 26). The remnant piles of the wharf are located beneath the cantilevered section of the sea scout building, within the CMA. Neither of the sites will be affected as a result of the proposed works.

Minor subsurface testing within the reserve identified a 24cm deep mixed grey/brown soil overlying a yellow clay subsoil (Figure 27, Figure 28). Testing along the unformed section of Traffic Road identified a modified mixed clay soil to a depth of c.18cm (Figure 29, Figure 30).

No archaeological or historic heritage remains were identified within the area of proposed works at Rahui Reserve and Traffic Road.

Greenhithe Road to South Wainoni Park

The proposed alignment then continues from the end of Traffic Road and Tauhinu Road along Greenhithe Road to South Wainoni Park. The works along this section are proposed to be open cut along the existing sealed road.

There are currently three historic heritage sites recorded within the Auckland Council CHI along Greenhithe Road (Figure 31). The sites comprise the ‘Old Greenhithe School’ building located within Collins Park, between 13 and 15 Greenhithe Road (Figure 32); Collins House located at 20 Greenhithe Road (Figure 33) and St Michael and All Angels Anglican Church located at 12 Greenhithe Road (Figure 34). Both the old school building and Collins House are scheduled as Category B Significant Historic Heritage Places within the PAUP (Appendix 9: 842 and 852). The site extents are illustrated in Figure 31.

These historic heritage sites will not be affected as a result of the proposed works, nor were any other archaeological or historic heritage sites identified within the proposed Greenhithe Road works area as a result of the current assessment.

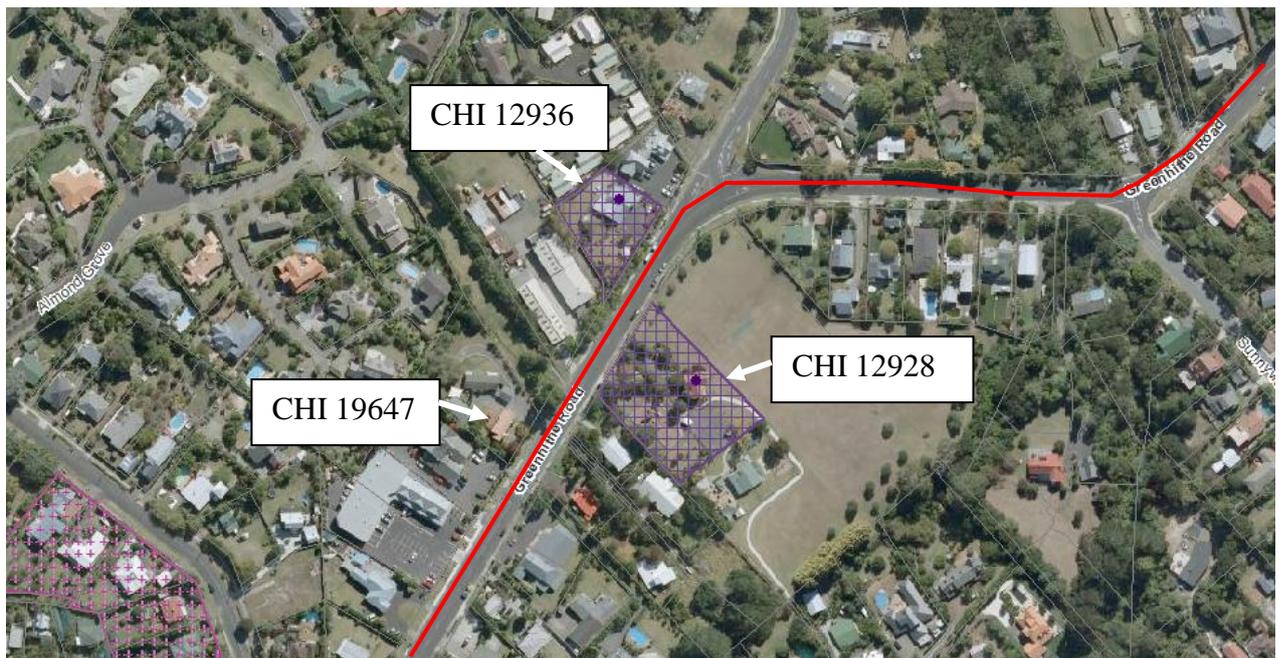

Figure 31. Aerial showing proposed alignment (marked in red), in relation to sites recorded within the Auckland Council CHI (note: CHI sites 12936 and 12938 also include scheduled site extents (purple hatching). Aerial source: Auckland Council GIS 2014

Wainoni Park

The proposed alignment runs north from Greenhithe Road through the eastern side of Wainoni Park (Figure 35). The park is currently utilised as a Pony Club and, as such, access was limited in some paddocks. The alignment is proposed to be open cut through the park with an HDD pit and line valves to be installed at the northern edge of the park and an access road will be formed from Churchill Road (Figure 35 and Figure 37). The alignment will then be directionally drilled beneath Te Wharau Creek to surface again inside the North Shore Golf Club property.

Identified archaeological sites within Wainoni Park are focused around the northern edge that is bounded by Te Wharau Creek. The sites comprise shell midden deposits related to pre-European Maori settlement of the Creek, located around the coastal edge. Sites located within close proximity are R10/1187 and R10/1188 (Figure 35). Site R10/1187 is recognised as being a Site and Place of Value to Mana Whenua within the PAUP (Appendix 4: 3217; Figure 36)

R10/1187 comprises patches of shell midden evident eroding and slumping from the foreshore bank onto the mudflats over a distance of c.30m. Sections of the midden remain relatively intact, but they do not appear to extend into the bank for more than 0.5m. The midden comprises predominantly cockle, with charcoal and bunt stone also identified (Figure 38, Figure 39).

R10/1188 comprises a very small patch of shell midden (less than 1m²) which is visible beneath a mature Norfolk Pine tree. Only cockle was identified. Visual survey and probing did not identify any further remains (Figure 40).

Continued on next page

FIELD SURVEY, CONTINUED

Wainoni Park, *continued*

Also noted around the foreshore area were four discrete patches of mixed historic and modern rubbish. Bottles, including black beers, string rim wines, whirly salad oils, case gin and schnapps bottles were present in abundance, as were fragments of ceramic tableware, some with the blue underglaze print of 'Asiatic Pheasant' identified (Figure 41, Figure 42). All of these items date to the latter half of the 19th century and through to the early 20th century. Modern items were also mixed through the debris including coca cola bottles, machine made screw top jars and plastic bottles. Although many of these items could possibly relate to the occupation of the site during the 19th century by the Churchouse family, it is not clear when they were deposited. Communications with Rachel Ford of Auckland Council determined that at the time of the last survey of the area (Robinson & Ford 2008 in: Brassey 2010), no historic rubbish was identified. This, together with the mixture of modern rubbish suggests that the material has been dumped here more recently and is therefore not historically 'in situ'.

At the request of Watercare, no subsurface testing was undertaken within the park. No other sites were identified within the remainder of the park.

North Shore Memorial Park

The proposed alignment is directionally drilled beneath Te Wharau Creek and surfaces just north of the vegetated area within North Shore Memorial Park. An HDD pit and line valves will be installed at this point. The remainder of the alignment is proposed to be open cut along the alignment of a future access road and then along the alignment of the existing sealed cemetery road.

There are currently three recorded archaeological sites located within the general vicinity of proposed works at North Shore Memorial Park. The sites all comprise coastal shell midden deposits (R10/817, R10/1181 and R10/1182). All of the sites are located within the heavily vegetated area along the southern boundary of the cemetery property (Figure 43). The sites are all recognised as being Sites and Places of Value to Mana Whenua within the PAUP (Figure 44).

R10/817 comprises a small but dense deposit of shell midden located on the south-facing foreshore bank. Only cockle was identified. The site is actively eroding onto the foreshore and does not appear to continue further inland (Figure 45).

Continued on next page

FIELD SURVEY, CONTINUED

North Shore Memorial Park, *continued*

Site R10/1181 comprises a patch of shell midden actively eroding down the moderate to steeply sloping north facing foreshore bank, opposite R10/817 (Figure 46). Shell is evident spread over an area of c.3m with no intact lens identified. Again, only cockle was identified with occasional pieces of charcoal.

Site R10/1182 is spread in patches along much of the extent of the small bay (c.50m; Figure 47 and Figure 48). The midden deposits comprise primarily cockle with some oyster also identified. One of the deposits is particularly ashy.

All of the recorded sites are located away from the proposed alignment and will not be affected.

Subsurface testing undertaken along the proposed alignment within the currently undeveloped section of the cemetery did not identify any further archaeological or historic heritage remains. Test pits showed a c.15cm thick layer of pale grey brown mixed soil overlying the sterile clay subsoil (Figure 44, Figure 49).

No archaeological or historic heritage remains were identified within the area of proposed works at North Shore Memorial Park.

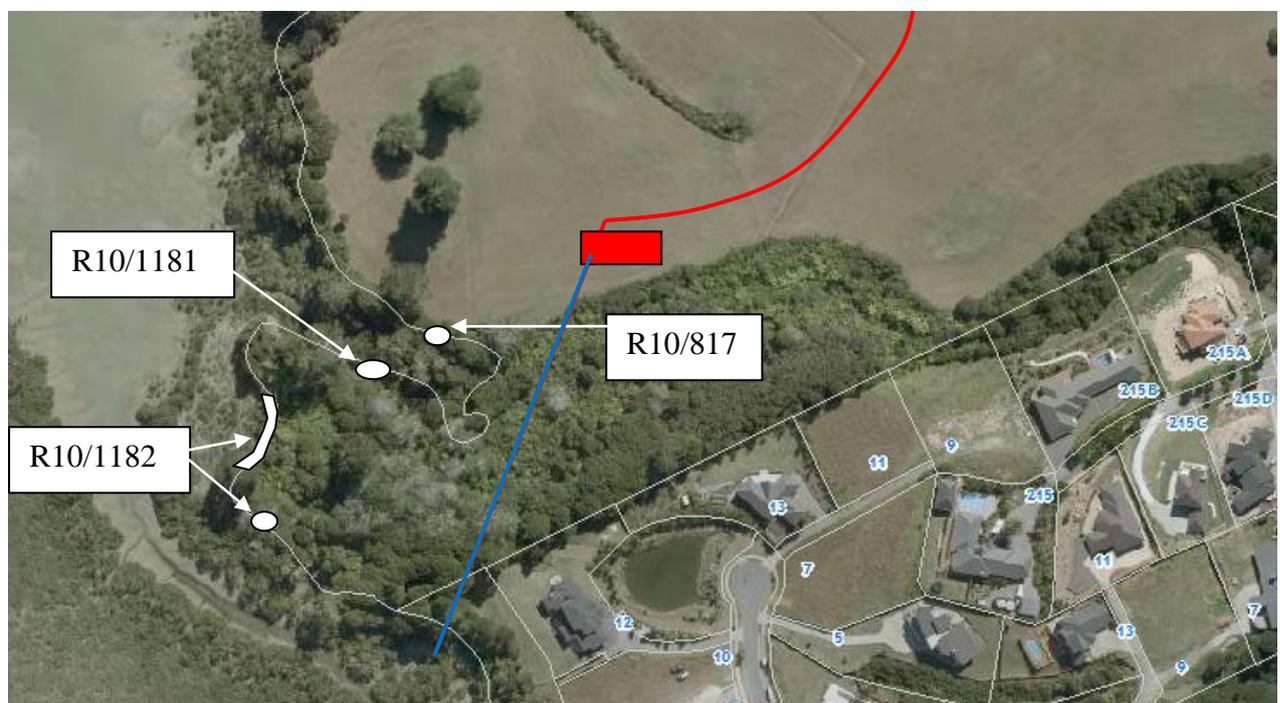

Figure 43. Aerial shows proposed alignment and excavation areas (open trenching marked in red, directional drilling marked in blue), in relation to the recorded archaeological sites. Aerial source: Auckland Council GIS 2014

FIELD SURVEY, CONTINUED

North Shore Memorial Park to Piermark Drive

Upon exiting from the North Shore Memorial Park, the proposed alignment follows down existing sealed road alignments, crossing the inland section of a remaining bush block into the North Shore Golf Club. The alignment is proposed to be open cut through the Golf Club property, along sealed Appleby Road (Figure 50), along John Glenn Avenue and across Albany Highway. The alignment then continues between industrial buildings to Piermark Drive (Figure 51) – a heavily developed commercial/industrial through road.

Inspection of the alignment through the Golf Club did not identify any archaeological or historic heritage remains. The area has been extensively modified for the development of the Golf Club and exposed soils generally comprised clay subsoils with a thin topsoil layer (Figure 52).

No archaeological or historic heritage remains were identified within the proposed area of works North Shore Memorial Park to Piermark Drive.

FIELD SURVEY, CONTINUED

Rosedale Park to Rosedale WWTP

The proposed alignment runs from the western edge of Rosedale Park (behind industrial and commercial buildings along Bush Road), through an area currently in pasture and utilised by the local pony club (Figure 53). The alignment then continues in an easterly direction, crossing Alexandra stream that runs through the Park (Figure 54) and following the existing formed road alignment to the Rosedale WWTP (Figure 55). These works are proposed to be open cut with the alignment directionally drilled beneath Alexandra stream.

Much of the area had been previously modified through formation of the WWTP and the park, as was evidenced through exposed clay soils and results of testing that showed only a very thin topsoil layer – especially east of the stream alignment (Figure 56). Visual survey and subsurface testing did not identify any archaeological or historic heritage remains within the proposed alignment through Rosedale Park.

DISCUSSION AND CONCLUSIONS

Summary of Results

The review of historic heritage databases identified seven archaeological and seven historic heritage sites recorded within c.100m of the proposed Northern Interceptor Phase 1 alignment from Hobsonville pump station to the Rosedale WWTP. The archaeological sites all comprise shell midden deposits related to pre-European Maori settlement of the Lucas Creek area and are located around the northern end of Wainoni Park and the southern coastal edge of North Shore Memorial Park. The historic heritage sites comprise mainly existing buildings located at Rahui Reserve and Greenhithe Road, as well as the remains of Greenhithe Wharf. None of the recorded sites will be affected by the proposed alignment, and no new sites were identified during the field survey.

Maori Cultural Values

This is an assessment of effects on archaeological values and does not include an assessment of effects on Maori cultural values. Such assessments should only be made by the tangata whenua. Maori cultural concerns may encompass a wider range of values than those associated with archaeological sites.

The historical association of the general area with the tangata whenua is evident from the recorded sites, traditional histories and known Maori place names.

Consultation has been undertaken with various iwi groups with interests in the project, including: Te Kawerau Iwi Authority and Ngati Manuhiri Settlement Trust. Sections of the current assessment(Wainoni Park and North Shore Memorial Park) were undertaken with Ngati Manuhiri representative Fiona McKenzie. Communications concerning the assessment have also been ongoing between Watercare and other affected iwi groups.

Survey Limitations

It should be noted that archaeological survey techniques (based on visual inspection and minor sub-surface testing) cannot necessarily identify all sub-surface archaeological features, or detect wahi tapu and other sites of traditional significance to Maori, especially where these have no physical remains.

Continued on next page

DISCUSSION AND CONCLUSIONS, CONTINUED

Archaeological Value and Significance

The general Hobsonville and Greenhithe areas are considered to have considerable archaeological significance based on the sites remaining that relate to both pre-European Maori and early European settlement of the areas. The Albany and Rosedale areas have less archaeological significance as relatively few sites have previously been recorded within these areas.

The proposed alignment passes within close proximity to sites related to all periods of occupation of the area; however no sites have been identified within the immediate area of works. While historic rubbish remains were identified within the proposed area of works at the northern end of Wainoni, these do not appear to be historically in situ and are therefore not considered to be an archaeological site.

The proposed area of works therefore has no known archaeological value or significance.

Effects of Proposal

The current proposal will have no known effects on archaeological or historic heritage values as no sites have been identified within the areas of works for the proposed Northern Interceptor Phase 1 alignment. The proposed works do however involve open trenching within the vicinity of recorded heritage buildings at Rahui Reserve and Greenhithe Road. A vibration report prepared by Tonkin & Taylor (2014) has assessed that works within these areas will be of low vibration risk with 'no risk to structures' (Tonkin & Taylor 2014:17-18).

However, in any area where archaeological sites have been recorded in the general vicinity it is possible that unrecorded subsurface remains may be exposed during development. It is considered possible that unrecorded subsurface archaeological sites may be exposed during development, particularly within coastal areas, i.e. Rahui Reserve, Wainoni Park and North Shore Memorial Park. If so, any previously unidentified remains are likely to be similar to those previously identified within the general area, namely coastal shell midden deposits or historic period remains.

If any archaeological remains should be exposed once construction was underway it would not be possible to avoid them due to the engineering requirements of the project.

Archaeological features and remains can take the form of burnt and fire cracked stones, charcoal, rubbish heaps including shell, bone and/or 19th century glass and crockery, ditches, banks, pits, old building foundations, artefacts of Maori and early European origin or human burials.

Continued on next page

DISCUSSION AND CONCLUSIONS, CONTINUED

Resource Management Act 1991 Requirements

Section 6 of the RMA recognises as matters of national importance: ‘*the relationship of Maori and their culture and traditions with their ancestral lands, water, sites, waahi tapu, and other taonga*’ (S6(e)); and ‘*the protection of historic heritage from inappropriate subdivision, use, and development*’ (S6(f)).

All persons exercising functions and powers under the RMA are required under Section 6 to recognise and provide for these matters of national importance when ‘*managing the use, development and protection of natural and physical resources*’. Archaeological and other historic heritage sites are resources that should be sustainably managed by ‘*Avoiding, remedying, or mitigating any adverse effects of activities on the environment*’ (Section 5(2)(c)).

Historic heritage is defined (S2) as ‘*those natural and physical resources that contribute to an understanding and appreciation of New Zealand’s history and cultures, deriving from any of the following qualities: (i) archaeological; (ii) architectural; (iii) cultural; (iv) historic; (v) scientific; (vi) technological*’. Historic heritage includes: ‘*(i) historic sites, structures, places, and areas; (ii) archaeological sites; (iii) sites of significance to Maori, including wahi tapu; (iv) surroundings associated with the natural and physical resources*’.

Regional, district and local plans contain sections that help to identify, protect and manage archaeological and other heritage sites. The plans are prepared under the rules of the RMA. The Auckland Council District Plan – Operative North Shore Section 2002 and the Proposed Auckland Unitary Plan (notified 2013) are relevant to the proposed activity.

There are currently four archaeological sites (R10/817, R10/1181 and R10/1182, R10/1187) scheduled as Sites and Places of Value to Mana Whenua within the PAUP (Appendix 4: 1978, 3211, 3212, 3217). The recorded extents of these sites will not be affected by the proposed works. The works do however fall within the PAUP mana whenua overlay buffers for these sites at both Wainoni Park and North Shore Memorial Park.

In addition, the ‘Old Greenhithe School’ building (CHI 12928) and Collins House (CHI 12936) are scheduled within the Operative Plan (Map 17: 5, 18) and within the PAUP (Appendix 9: 842, 852) as Category B Historic Heritage Places. The Tauhinu Scout Den at Rahui Reserve is also scheduled as a Category B building within the Operative Plan (Map 17: 504). At Hobsonville Duke House, (CHI 3507) is scheduled in the PAUP (Appendix 9: 130).

None of these sites will be affected as a result of the current proposed works, but as the works are within 50m of the defined extents of place of the Old Greenhithe School, Collins House and Duke House, consent may be required under the PAUP rules.

Continued on next page

DISCUSSION AND CONCLUSIONS, CONTINUED

Resource Management Act 1991 Requirements, continued

This assessment has established that the proposed activity will not affect any known archaeological or built heritage remains, but has the potential to affect unidentified subsurface archaeological remains that may be exposed during development. If resource consent is granted, it is recommended that a requirement for monitoring of works within Wainoni Park North, Rahui Reserve and the southern section of works at North Shore Memorial Park is included as a condition and that an Accidental Discovery Protocol is adopted for the remainder of works required for the project. It is also recommended that an advice note regarding the provisions of the HNZPTA is included.

Heritage New Zealand Pouhere Taonga Act 2014 Requirements

In addition to any requirements under the RMA, the HNZPTA protects all archaeological sites whether recorded or not, and they may not be damaged or destroyed unless an Authority to modify an archaeological site has been issued by Heritage NZ (Section 42).

An archaeological site is defined by the HNZPTA Section 6 as follows:

‘archaeological site means, subject to section 42(3), –

(a) any place in New Zealand, including any building or structure (or part of a building or structure) that –

(i) was associated with human activity that occurred before 1900 or is the site of the wreck of any vessel where the wreck occurred before 1900; and

(ii) provides or may provide, through investigation by archaeological methods, evidence relating to the history of New Zealand; and

(b) includes a site for which a declaration is made under section 43(1)’³

Authorities to modify archaeological sites can be applied for either in respect to archaeological sites within a specified area of land (Section 44(a)), or to modify a specific archaeological site where the effects will be no more than minor (Section 44(b)), or for the purpose of conducting a scientific investigation (Section 44(c)). Applications that relate to sites of Maori interest require consultation with (and in the case of scientific investigations the consent of) the appropriate iwi or hapu and are subject to the recommendations of the Maori Heritage Council of Heritage NZ.

Continued on next page

³ Under Section 42(3) an Authority is not required to permit work on a pre-1900 building unless the building is to be demolished. Under Section 43(1) a place post-dating 1900 (including the site of a wreck that occurred after 1900) that could provide ‘significant evidence relating to the historical and cultural heritage of New Zealand’ can be declared by Heritage NZ to be an archaeological site.

DISCUSSION AND CONCLUSIONS, CONTINUED

**Heritage New
Zealand
Pouhere
Taonga Act
2014
Requirements,
*continued***

In addition, an application may be made to carry out an exploratory investigation of any site or locality under Section 56, to confirm the presence, extent and nature of a site or suspected site.

While no known archaeological sites will be affected by the proposed works, it is possible that unidentified subsurface archaeological remains may be exposed during development.

In order to avoid any delays should unidentified subsurface features be exposed by the proposed works, consideration could be given to applying for an authority under Section 44(a) of the HNZPTA to cover all works undertaken for this project, as a precaution. This should be obtained before any earthworks are carried out. The conditions of the authority are likely to include archaeological monitoring of preliminary earthworks in specified areas, and procedures for recording any archaeological evidence before it is modified or destroyed.

Conclusions

Seven archaeological and seven other historic heritage sites have previously been recorded within c.100m of the proposed Northern Interceptor Phase 1 alignment. The recorded extents of these sites will not be affected as a result of the proposed works. However, there is some potential for previously unrecorded archaeological remains to be uncovered during works, particularly within the coastal areas including: Rahui Reserve, Wainoni Park North and the southern edge of North Shore Memorial Park. Due to this potential it is recommended that an Authority under the HNZPTA is sought prior to the start of works, and that works within these areas are monitored by an archaeologist to establish whether subsurface remains are present.

RECOMMENDATIONS

**It is
Recommended:**

- That the detailed development plans take account of the locations of the recorded archaeological sites, and ensure that they are avoided.
 - That the recorded midden site R10/1187 in the vicinity of proposed earthworks in Wainoni Park is temporarily marked out or fenced off prior to the start of earthworks to protect it from accidental damage from heavy machinery.
 - That if any of the recorded sites cannot be avoided, an Authority must be applied for under Section 44(a) of the HNZPTA and granted by Heritage NZ prior to the start of any works that will affect them. (*Note that this is a legal requirement*).
 - That because it is possible that subsurface archaeological remains may be exposed during development, an Authority should be applied for under Section 44(a) of the HNZPTA as a precaution prior to the start of earthworks. This would establish appropriate procedures for the management of any archaeological remains discovered, reducing the potential for delays during the development process.
 - That earthworks at Rahui Reserve, Wainoni Park North and the southern end of works at the North Shore Memorial Park should be monitored by an archaeologist to establish whether any unrecorded subsurface remains are present.
 - That in the event of koiwi tangata (human remains) being uncovered, work should cease immediately in the vicinity of the remains and tangata whenua, the Heritage NZ, NZ Police and Council should be contacted so that appropriate arrangements can be made.
 - That since archaeological survey cannot always detect sites of traditional significance to Maori, such as wahi tapu, the tangata whenua should be consulted regarding the possible existence of such sites along the length of the proposed alignment.
-

Grid Reference	Easting	26 6 0 1 00	Northing										
			64 9 2 2 00										
1. Aids to relocation of site (attach sketch map) Within lot DP 21264. At the end of a broad flat ridge running southwest towards Lucas Creek a small promontory extends into the estuary. This promontory lies to the north Te Wharau Creek on the northern side of a small inlet. A mature macrocarpa is located at the base of the ridge 10-15m back from the estuary. A bearing from this to totara tree over midden is 196deg.													
2. State of site and possible future damage: Eroding into estuary below, roots of pine and totara disturbing the deposit. A large section of the midden has slumped to just above the estuarine mud.													
3. Description of site (Supply full details: history, local environment, references, sketches, etc. If extra sheets are attached, include a summary here)													
Shell midden is located on top of bank, comprising mainly cockle (medium-small 80%) with some oyster. The deposit is dense and ashy in parts and contains small firecracked stones. Although there are few lumps of charcoal, the soil is black.													
4. Owner North Shore Cemetery and Crematorium Address Schnapper Rock Rd.		Tenant/manager Address											
5. Nature of information (hearsay, brief or extended visit) Brief Visit

NZMS 260 map name	Auckland	Type of site or area	WHARF SITE
NZMS 260 map edition	2006	Name	Greenhithe wharf
Grid references Easting:	2659150	Northing	6490200
1. Aids to relocation of site (attach a sketch map):			
Traffic Road Greenhithe Upper Waitemata Harbour			
2. State of site and possible future damage:			
No trace visible at high tide. 09 Dec 2008: Three posts remain. Two are resting against the blue-stone rock wall on appears to have been built around and is embedded in the wall.			
3. Description of site (supply full details, history, local environment, references, sketches, etc. If extra sheets are attached include a summary here)			
Wharf. Served by ferry. A 513 ft (156.4m) wharf with a 482 ft (147m) walkway, 6ft (1.8m) wide, pierhead 31 ft (9.4m) x 22 ft (6.7m), plus steps, a wooden shed 13x13 ft (4x4m) for goods and passengers, and a freight crane. Later railway lines were added in order to trolley goods to and fro from the boats. Produce and freight would be winched down the steep bank, at the end of what is now called Traffic Road. In 1910 to cope with increase of fruit a cargo shed was built next to the waiting room on the wharf. In 1939 the sheds were damaged by a gale and the waiting shed (10x8ft, 3x2.4m) only was replaced.			
Additional Notes:			
Additional information by James Robinson and Rachel Ford (09 Dec 2008): Very little of the wharf remains apart from three posts and some iron fittings. The site is currently located under the Sea Scouts building.

Clark Point Hobsonville Upper Waitemata.			
2. State of site and possible future damage:			
3. Description of site (supply full details, history, local environment, references, sketches, etc. If extra sheets are attached include a summary here)			
World war II American airplane crash site.			
Additional Notes:			
A Hudson bomber crashed into the harbour off Hobsonville and the tail could be seen sticking out from the mud just below the sewer beacon, visible from the Upper Harbour Crossing at Greenhithe. SE 1250 p.43. Is this the same one? Also a Dakota crashed somewhere (SE 176). Additional information by Malcolm Hahn (2006): Extract from 'God Willing and Weather Permitting': 65 years after a Lockheed Hudson bomber crashed into the mud flats, the remains of the war plane can still be seen beside the approaches of the Upper Harbour Bridge when the tide is out. On the night of the 25th January 1943, the crew of two were doing what is called circuits and bumps, which basically is practice landings under emergency situations, when the plane lost height and crashed into the water. It is thought that both of the crew drowned when they attempted to swim ashore towards Herald Island.

1. Aids to relocation of site (attach a sketch map):			
Hobsonville Massey Waitemata			
2. State of site and possible future damage:			
NZAA Condition: Partly damaged, continuing minor damage Mostly destroyed by road cutting			
3. Description of site (supply full details, history, local environment, references, sketches, etc. If extra sheets are attached include a summary here)			
On top of point, edge of Hobsonville air base, in top of cutting on south side of western approach to upper harbour bridge. 10m ASL & 300m NW of airbase main gate. 10 x 0.2m shell layer exposed that formerly extended over flat top of point. Contains Chione, Crassostrea, Amphibola and charcoal.			
Additional Notes:			
Additional information by Don Prince 2001. A systematic inspection of the cutting on the south side of the western approach to the Upper Harbour Bridge failed to detect any evidence of the site recorded in 1977 by Haywood and Diamond. There is some confusion in interpreting Haywood and Diamond's aids to relocation (R11/495), as their description of the site being "300m northwest of airbase main gate" contrasts with the recorded grid reference co-ordinates that place the site to the north east of the gate house. It is assumed that the grid reference co-ordinates are correct and the north west description is a typing error. However, as no evidence was detected at either location, the entire cut was inspected. The cut today has a dense, and in places, impenetrable vegetation cover (kykuyu grass, gorse, pampas grass, mixed regenerating native and pine) that may conceal evidence of the site.

1. Aids to relocation of site (attach a sketch map):			
North Shore Memorial Cemetery Albany Upper Waitemata			
2. State of site and possible future damage:			
NZAA Condition: Partly damaged, risk of severe damage March 2003. Some coastal erosion, damage from rabbits. Possible future damage from cemetery expansion. Dec 2008. Continual coastal erosion. No evidence of rabbit burrows.			
3. Description of site (supply full details, history, local environment, references, sketches, etc. If extra sheets are attached include a summary here)			
Additional Notes:			
Additional information by Russell Foster (March 2003). Close to southern boundary of cemetery, on northern edge of small stream inlet. Shell midden exposed along top of bank under trees. Patchy midden extends north towards to two tall trees on centre of ridge (GR for 'rabbit hole') where thick midden exposed by rabbits. Surface shell scatter noted around southern and western sides of tree in left centre of photograph. It is probable that additional occupation evidence is present. Recommendations: Add to District Plan. Extent of site needs thorough investigation before any ground modification is undertaken in this part of reserve. This is particularly important as the assessment undertaken for the cemetery did not identify the full extent of this midden. Additional informaion by James Robinson and Rachel Ford (Dec 2008): Midden located along 4m of the coastal bank facing south 1.5-2m up the bank. Lens is highly eroded. Contains dark grey soil matrix with 99% of shell material being cockle. Also some charcoal and fire cracked rock present.

3. Description of site (supply full details, history, local environment, references, sketches, etc. If extra sheets are attached include a summary here)			
Site is located on small peninsula on the southern section of the North Shore Memorial Cemetery along Lucas Creek. The site may be part of CHI 11730 (R10_1181) as one large site. CHI 11731 consists of a number of intermittent middens around a small headland. The first two GPS coordinates (E 2660061, N 6492293 & E 2660060, N 6492266) have midden that consist primarily of cockle with some oyster and mudsnail. The third GPS point (E 2660053, N 6492240) on the other side of the small headland is similar but also contains pipi.

<p>Reference Source: - King, R. E. Tauhinu – A History of Greenhithe. Auckland: R. E. King, 1984, p124- 126 & 151. North Shore City Council property file no. 3133166 NZHPT Listing: Not registered by NZHPT. Significant Elements: Extent of Listing: Entire exterior of church building. History: Fundraising: The construction of St Michael and All Angels Church was a long process that began in the late 1920s. The fund collected was largely donations and bequests of parishioners, of which Mrs. MacCallum contributed a large sum of £500 in 1953, and Mr. Cyril and Mrs. Marjorie Jonkers (JP, QSM) put in their deceased son's savings in 1954. The Jonkers family was well known in Greenhithe. They ran an orchard in Rame Road and later established a fruit canning business that provided job opportunities for many local residents. Mr. Jonkers was the secretary of the Greenhithe community hall committee and was in charge of a commando unit made up of men from Paremoremo, Greenhithe, Glenfield and Albany during WWII. In 1983 Mrs. Jonkers was awarded the Queen's Service Medal. MacCallum and Jonkers' offering was a large step towards the establishment of an Anglican church. In the following year in 1955, the site now known as 12 Greenhithe Road was purchased by church authorities from Mr. Blakeway for the construction of the church. On 25th of March 1956, the foundation stone of St Michael and All Angels Church was laid by Bishop Simpson who was the Bishop of Auckland at that time. The construction of the church was made possible after various proposals were turned down and finally Mr. Jonkers proposed that the church was to have an iron roof and to remain unpainted, with a £700 contribution from the vestry for furnishings. Mr. and Mrs. Jonkers also supplied timber from their property for the construction of the church, and labour assistance was provided not only by Anglican Church worshippers but also many non-Anglicans. The timber-constructed St Michael and All Angels Church sits on a brick foundation. It is unclear whether the church was indeed completed with an iron roof and unpainted. However the earliest photographic evidence of the church found to date shows a tiled gable roof. It also shows that the street-facing window at the eastern end of the church was originally a simple six-light window, which is now a stained window featuring a white cross; and that the picket fence surrounding the church ground had since been removed. In 1996, a Lockwood show home was moved to the church ground to serve as a vicarage to accommodate the first full time priest of the area, Reverend Mark Taylor. In the same year, a telecommunication mast was erected within the church ground, although some surrounding neighbours objected to this. It was decided subsequently that the telecommunication tower was to be finished in natural shades and camouflaged by foliage to lessen its visual impact. Currently St Michael and All Angels Church caters mainly Anglican worshippers but offers a Methodist service once a month. It is used occasionally as a voting booth during elections. Physical Characteristics: Style: The church does not reflect any particular architectural style. Construction/Craft Technology: The church is of timber framed construction on masonry foundation walls. Its construction/craft technology is of no significance. Age: St Michael and All Angels Church was constructed in 1956. Architect/Builder: The design and construction of the church is a combined effort of church worshippers and local community members. Design: Further information on the church is required for an assessment of its design significance to be made. Rarity and Representativeness: St Michael and All Angels Church is the first and remains the only church</p>			

building of any denomination in the Greenhithe area. Its representativeness is of considerable significance.

Authenticity:
Site: The church is in its original position.
Curtilage: The curtilage of the church is modestly landscaped and complements the humble character of the building. The removal of the picket fence along the street front site boundary has an effect of no more than minor in the authenticity of the curtilage.
Alterations: Apart from the installation of the front elevation stained window, it is unclear whether the building has undergone any other alterations.
Structural Integrity: It is unclear whether any work has been carried out

that affected the structural integrity of the building.

Associations:
Person: The church is associated with Cyril and Marjorie Jonkers. Cyril Jonkers was a well-recognised local figure and Marjorie Jonkers was a Queen's Service Medal recipient. These associations are of moderate significance.
Event: The church is not associated with any event of importance.
Social/Cultural Patterns or History: St Michael and All Angels Church is the first religious building constructed in the area that demonstrates the increasing number of worshippers living in the area to warrant the necessity of a local church. Its association to this local social pattern is of moderate significance.

Environmental Contribution:
Group Value: The church does not belong to any recognised group of buildings.
Townscape Value: The church is of moderate significance in contributing to the development of Greenhithe Village hub in the post-World War II period.
Landmark Value: The church is of minor landmark value within the vicinity of Greenhithe.
Setting: The setting is an evenly balanced combination of foliage and open space that is complementary to the church as well as the Greenhithe area.

Statement of Significance
Architecture:
St Michael and All Angels Church is the first and remains the only religious building in Greenhithe. It is of considerable significance in representing a rare building typology in the area.
History:
The church is of moderate historical significance in illustrating the increased residential habitation resulting in the increase of worshippers in Greenhithe that in turn heightened the desire of a dedicated church building. It is also of significance due to its association with a well known family in the local community of which one of the members is a Queen's Service Medal recipient.

Context:
The church is a landmark in the vicinity of Greenhithe. It is of moderate contextual significance as it contributes to the post-World War II development of the Greenhithe Village hub. Its setting is compatible with the surrounding area.

NZHPT Listing: Not registered by NZHPT.

Significant Elements:
 Extent of Listing: Entire exterior of building (includes that portion of the building located above Mean High Water Spring)
 History: The Tauhinu Sea Scouts building dates to 1955. It is currently utilized by one of the six sea scout groups on the North Shore. In 1969 the Department of Lands & Survey agreed to the Tauhinu Sea Scouts' request to erect a building for their headquarters at the current site, a local authority designated recreation reserve. The building is a combination of timber and concrete construction. It is often referred to as the 'Ship' by the Tauhinu Sea Scouts. To the south of the building is a concrete dinghy ramp believed to be erected in 1987. In 2010, Tauhinu Sea Scouts proposed a boat shed extension to the building. The proposal was made in response to the lease termination of the group's storage facility at the old Hobsonville air base. Initially the proposal featured an additional storey above the existing building which was not further pursued. The group later proposed an alternative option of extending directly to the south such that the extension occupies the space between the existing building and dinghy ramp.

Physical Characteristics:
 Style: The sea scouts' headquarters is not of a notable architectural style.
 Construction/Craft Technology: The building does not feature any notable construction/craft technology.
 Age: The building was constructed c.1969 and the dinghy ramp in 1987.
 Architect/Builder: The architect and builder remain unidentified. The District Plan schedule does not have jurisdiction to consider that portion of the building which is physically located within the coastal marine area (CMA)- only that area above mean high water spring.
 Design: The building is of no particular design significance.
 Rarity and Representativeness: Tauhinu Sea Scouts is the only sea scout group in the Albany ward, and one of the six sea scout groups in the North Shore City. It represents a branch of scouts that focuses on water-based activities due to its geographic location and water surrounds. The Tauhinu Sea Scouts' headquarter is of considerable significance as an example of a purpose built sea scout facility in the area, and particularly represents the area's development themes of sport and community organizations and facilities.

Authenticity:
 Site: The sea scouts' headquarters remains on its original site.
 Curtilage: The dinghy ramp is of minor significance in enhancing the interpretation of the history and use of the building.

Alterations: It is unclear from the information available whether alterations have been carried out at the sea scouts' headquarters.
 Structural Integrity: It is unclear from the information available whether any alterations have been carried out that have affected the structural integrity of the sea scouts' building.

Associations:
 Person: The building and dinghy ramp were purpose-built for the Tauhinu Sea Scouts and the structures remain closely associated with the group. The group has been recognised by the Royal New Zealand Navy Chief of Naval Staff for its positive contribution to Sea Scout Group management. Tauhinu Sea Scouts' direct association with the building is of moderate significance.
 Event: The sea scouts' headquarters is not associated with any important event.
 Social/Cultural Patterns or History: Travelling by water is an important means of transport to and from the North Shore. The development of the Tauhinu Sea Scouts and its association with sailing and water safety training is of moderate significance in demonstrating this social pattern.

Environmental Contribution:
 Group Value: The sea scouts' headquarters does not belong to any recognised group of built structures in its immediate environment. However in the wider context, it is associated with the other five sea scouts bases on the North Shore and this group value is of minor significance.
 Townscape Value: The sea scouts' headquarters is of minor significance as an example of modest built developments along the coastal edge, which forms part of the Greenhithe historic townscape.
 Landmark Value: The sea scouts' headquarters is of minor landmark value.
 Setting: The setting of the sea scouts' headquarters by the water is compatible with the function of the facility.

Statement of Significance
 Architecture: The Tauhinu Sea Scouts headquarters building is of considerable architectural significance as the only sea scouts headquarter in the North Shore City that has a physical relationship to the sea, being partly built in the water.
 History: The building is of moderate historical significance, having a direct association with the Tauhinu Sea Scouts, whose efforts in providing training on sailing and water activities has been recognised by the Royal New Zealand Navy Chief of Naval Staff.
 Context: The sea scouts' headquarters is of minor contextual significance.
